                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to the cloning and sequencing of the cluster encoding a modular type I polyketide synthase (PKS) enzyme involved in the biosynthesis of the macrolide antibiotic nystatin. The nystatin PKS is useful as antifungal antibiotics. The present sequence is a Streptomyces noursei nystatin PKS gene cluster DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 125401 BP; 15664 A; 49692 C; 42871 G; 17174 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAQ73500 shows the Pseudorabies virus (PRV) large latency transcript (LLT). The basic sequence is derived from PRV strain InFh and PRV strain Ka. The LLT overlaps and is transcribed in the opposite orientation with respect to the EPO (early polypeptide 0) and the Immediately early gene (IE180). EPO is nonessential for replicatio, LLT is the only gene expressed during PRV latency, and the IE180 gene is absolutely necessary for PRV replication. However there are 2 copies of IE180 in the genome. It is expected that PRV lacking one of the IE180 copies is viable. Deletions in the non-overlapping regions of these 3 genes will generate single deletion routants, while deletions in overlapping regions will generate double deletion mutants.
                                                                                                                                                                                                                                                                                                                                                                                                                          mutants. The invention is concerned with the construction of attenuated viruses which have a reduced ability to reactivate from latency. This can be achieved by functionally disabling the expression of the EPO gene, or by disrupting the synthesis of the LLT, or both (See also AAQ73501 and AAR60620-24)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       misc_feature

                                                                                                                                                                                                                               non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AAX55272-74. These multiple target oligonucleotides (specifically AAX55180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to the cloning and sequencing of the cluster encoding a modular type Tolyketide synthase (PKS) enzyme involved in the biosynthesis of the macrolide antibiotic nystatin. The nystatin PKS is useful as antifungal antibiotics. The present sequence is a Streptomyces noursei nys2 DNA of nystatin PKS gene cl

The invention relates to an isolated ramoplanin biosynthetic pathway polypeptide selected from a polypeptide of open reading frames (ORF) 1-32. The isolated polypeptides are useful for chemically modifying a biological molecule that is a substrate for a polypeptide encoded by ramoplanin biosynthesis gene cluster, by contacting the biological

밁 맑 γQ 밁 δÃ δõ В δÃ δÃ ₽ Qy В δÃ ₽ Ş 밁 δÃ 밁 δÃ gene cluster comprising the ORFs is useful as substrate for the Comprising the ORFs is useful as a substrate for the Comprising the ORFs is useful as a substrate for its cenceding nucleic acid sequence is useful for generating derivatives of cenceding nucleic acid sequence is useful for generating derivatives of comproving production or for producing variants of other cantibiotics of the peptide class. The isolated polypeptides are useful for synthesis of ramoplanin in vivo or in vitro, as an adenylation domain in conjunction with other peptide synthetase modules and allowing the incorporation of Thr into a peptide antibiotic precursor, for modifying fatty acid structure and/or enhancing fatty acid incorporation into the peptide antibiotic structure, for production of an hydroxyphenylglycine campolanin or its variants and derivatives, for enhancing uptake of precursors for ramoplanin biosynthesis, for enhancing production of campolanin products or its variants or derivatives, to chlorinate HPG of a peptide antibiotic precursor, and for designing specific nucleotide probes and primers for identifying and isolating putative lipdepsipeptide producing microorganisms. This polynucleotide sequence represents the intercorpanism of the invention producing Actinoplanes sp. Matches Query Match Best Local 46410 46290 46230 molecule with the isolated polypeptide, where the polypeptide chemodifies the biological molecule. The method comprises contactin biological molecule with at least two different polypeptides encramoplanin ORFS 1-31. The polypeptides are useful for directing biosynthesis of the antibiotic ramoplanin in microgranisms. An objective statement of the control of the con Sequence microorganism 35 95 GCGGCTCTTACCGTTTCGAGCGCTTCGCCGACTACCTGGACGCGTTGCGGGCCACGCCGG ACGCCGCGGGGGGGGGAGGCGCCGAGTCGGAGACCCTGCCCGTCCAGTACGCCG TCAGCCTGGCGCCGCCACGCCAACCCGCCCCCCCGGACCTGCACGAAG GCGACATGACGCCCAAGATCTCGCAGGGCGTCACCACCGGTGGTCACGGGCAATTGCGGCA ACTACGCCCTCTGGCAGCGTGACCTGCTGGGCTCCGACAGCGACCCGGCGAGCCTGATCT CGCCCGGCTTCATCGACTCGCACACCCACGACGACGACTACCTGCTCAG-+---GGGTCGAGGAGGCGGTCGCCGAAGCGGCCGCGTACGCCTTCGACCTGGCCCGGGAGATCC TCGGCGATCTGTCGGACGCCGCGCGCACACCCCGGGTCGACGTGTCGGGCCTGGTGGTCG TGGCCCGGCACGAGGTGCTGCGCACGGTGTCACGGTCGCCGACGGCGAGCCGTGGCAAC 46289 ACTTGCAGCGCCGCCACCGACGAGGAAATCGCGGCCATGCGGGACCTGGCCGAGGAAG CCCGGCAGATCGCCCACTGGCGCGAGCGGCTCGACGGCGTGCCGGAGGAGCTGGACCTGC ACCACATCGCGGCCGACGGCTGGTCGATGCGGCCGCCTGGCCGACCTGGCGACCGCCT Similarity 88421 BP; Conservative of. the 10639 A; 32391 C; 32663 G; 12728 4.98; invention.                                                                                                                                                                                                                                                                                                        CC biosynthetic gene cluster, or fragments thereof. The macrolide CC biosynthetic gene cluster encodes proteins which synthesise methymycin, permethymycin, narbomycin or a combination of these CC compounds. Recombinant or augmented cells comprising the desosamine CC and/or macrolide biosynthetic gene clusters are useful for the CC proteins are useful for synthesis of methymycin, pikromycin, cc neomethymycin and narbomycin. The alternative termination of polyketide CC polyhydroxyalkanoate (PHA) monomers. The compounds produced by the CC recombinant host cells are useful as biopolymers, e.g., in packaging or biomedical applications, to engineer PHA monomer synthases or to prepare CC immunosuppressants, agents to treat asthma, chronic obstructive pulmonary CC cholesterol-lowering agents or macrolide-based antibiotics which are cative against a variety of organisms, e.g., bacteria, including CC as viral parasitic pathogens, or as crop protection agents (e.g., CC fungicides or insecticides) via expression of polyketides in plants. CC sequences AA287286-287294 represent desosamine biosynthetic genes from CC CANATAIRS.

The invention also relates to a modified recombinant bacterial host cell (mRBHC) in which the expression and activity of nucleic acids encoding sugar biosynthetic enzymes has been altered. The mRBHCs may be cultured to produce the modified sugar products, e.g. a macrolide, anthracycline, angucycline, avermectin, milbemycin, tetracycline, polyene, polyether, ansamycin or isochromanequinone. The present sequence is Streptomyces venezuale sugar (desosamine) biosynthetic gene cluster neer 1,4 debudges venezuale sugar (desosamine)

useful to prepare novel antibiotics and polyhydroxyalkanoate (PHA) monomers. The compounds produced by the recombinant host cells are useful as biopolymers, e.g., in packaging or biomedical applications, to engineer PHA monomer synthases or to prepare biologically active agents, such as chemotherapeutics, immunosuppressants, agents to treat asthma, chronic obstructive pulmonary diseases as well as other diseases involving respiratory inflammation, cholesterol-lowering agents or macrolide-based antibiotics which are active against a variety of organisms, e.g.,
                                                                                                                                                                                                                                                                                                                                                                                                           compounds. Recombinant or augmented cells comprising the desosamine and/or macrolide biosynthetic gene clusters are useful for the production of biologically active macrolides. The macrolide biosynthetic proteins are useful for synthesis of methymycin, pikromycin, neomethymycin and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 comprising a desosamine biosynthetic gene cluster, a fragment or its biologically active variant, where the nucleic acid sequence is not derived from the eryC gene cluster of Saccharopolyspora erythraea or Streptomyces antibioticus. The invention also relates to a macrolide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Desosamine and macrolide biosynthetic gene clusters, useful for, synthesis of methymycin and pikromycin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 2000-160679/14

pikromycin, neomethymycin, narbomycin or a combination of these compounds. Recombinant or augmented cells comprising the desosamine and/or macrolide biosynthetic gene clusters are useful for the production of biologically active macrolides. The macrolide biosynthetic proteins are useful for synthesis of methymycin, pikromycin, neomethymycin and narbomycin. The alternative termination of polyketide synthesis may be useful to prepare novel antibiotics and polyhydroxyalkanoate (PHA) monomers. The compounds produced by the recombinant host cells are useful as biopolymers, e.g., in packaging or biomedical applications, to engineer PHA monomer synthases or to prepare biologically active agents,
                                                                                                                                                                                                                                                                                                                                                   biologically active variant, where the nucleic acid sequence is not derived from the eryC gene cluster of Saccharopolyspora erythraea or Streptomyces antibioticus. The invention also relates to a macrolide biosynthetic gene cluster, or fragments thereof. The macrolide biosynthetic gene cluster or fragments thereof, synthesise methymycin, biosynthetic gene cluster encodes proteins which synthesise methymycin,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CDS
                 such as chemotherapeutics, immunosuppressants, agents to treat astima, chronic obstructive pulmonary disease as well as other diseases involving respiratory inflammation, cholesterol-lowering agents or macrolide-based antibiotics which are active against a variety of organisms, e.g.,
